

# FCU320 Daisy-chain

The modules are connected in daisy-chain through the HUB320, this allows to connect the FCU320 5-pole DIN expansion socket to the 4-pole modules. The 5 pole DIN cable goes on the HUB320 input where the outputs connect and also provides power to the modules. 5-pole cable and power adapter are provided with the HUB320.

On the daisy chain, the FCU320 forms the master. Each slave consisting of a single module (i.e. RMP320) or of a group (i.e. TRM320), in this case the main component of the group is connected to the daisy-chain, while its boundary parts are connected to the main component through dedicated cables. In the diagram shown, the groups are represented with the same color.

- Daisy-chain (5 pole DIN cable)
- Daisy-chain (4 pole flat cable)
- Group interconnection (various flat cables)
